

Cassidian comes out on top at the 2013 International TETRA Awards

- TH1n, the world's smallest terminal provided by Cassidian, beat four other high-quality products nominated in the 'Best TETRA Enterprise Product' category.
- The International TETRA Awards recognize excellence in the field of TETRA radio communications and have awarded Cassidian a prize for its product.

The smallest ever TETRA terminal recently won the 2013 International TETRA Awards for the 'Best TETRA Enterprise Product'. Since the TH1n is ideal for many different users, it has opened up the TETRA market to those in new sectors, such as social workers and health care personnel. In particular, it addresses users who have the option of joining shared public safety networks, but who so far haven't found a model to suit their needs better than a heavy-duty radio targeted at fire fighters. Equipped with appropriate accessories, TH1n is also suitable for covert use thanks to its thin, compact design.

The ability to access and share data in the field is becoming increasingly important, and the TH1n also delivers in this respect, enabling field operatives to perform data queries and send reports. They can take advantage of the Java platform, which enables many types of easy-to-use applications thanks to the possibility of tailor-made user interfaces.

Cassidian is a global leader in secure radio communication networks, with more than 230 networks deployed in 70 countries and a base of more than one million terminals sold.
